### DISCOVERED HOSTS SUMMARY

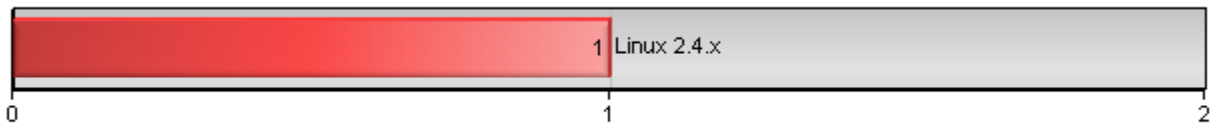

#### Top Ten Networks by Active System Count

Network Name	Active IP Addresses	Total IP Addresses Scanned
54.174.156.235	1	1
<b>Total</b>	<b>1</b>	<b>1</b>

<b>Total Active Systems</b>	<b>1</b>
-----------------------------	----------

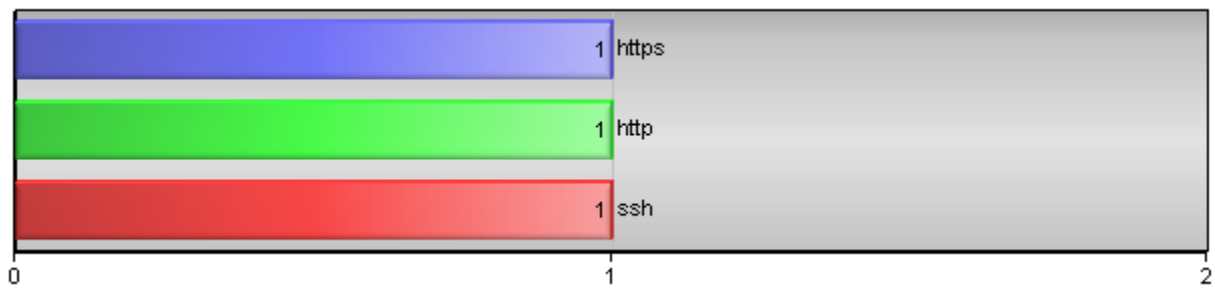

**Note:** McAfee Vulnerability Manager uses a customizable rule-based system to track individual assets, hence it is possible that multiple discovered hosts match a single asset based on currently configured rules. For this reason, the number of Active Systems (assets) displayed in the Discovered Hosts or Assets Summary section can be less than the total number of Hosts Found in the scan status page.

Top 15 Operating Systems Found

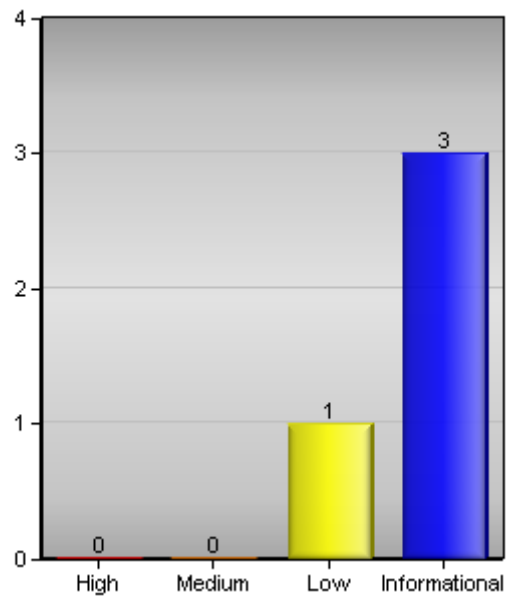

- + Denotes operating system identification was achieved through NULL session access.
- ++ Denotes operating system identification was achieved through credentialed access.
- \* Denotes operating system comes from ePO.
- \*\* Denotes multiple operating systems fingerprinted on the same IP address. This can occur under situations such as port forwarding.

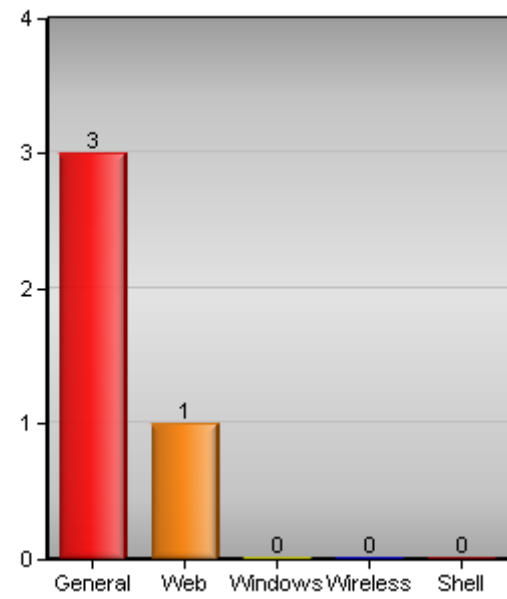

Top 15 Services

## FoundScore Risk Rating

You scored a total of **95** out of a possible **100** points. Your FoundScore as of **2015-07-06 01:42:40** places you in the **Excellent** category. Thus, relative to other organizations, your risk rating is **excellent**. Please review the Results graph and Categories table below for details.

### FoundScore Results

The solid bar indicates the maximum possible deductions for each category. The transparent bar indicates the number of deductions actually taken.

FoundScore: Vulnerabilities	Your Results	Deductions	Running Score
<a href="#">High Risk Vulnerabilities</a>	0	0	100
<a href="#">Medium Risk Vulnerabilities</a>	0	0	100
<a href="#">Low Risk Vulnerabilities</a>	1	5	95
<a href="#">Informational Risk Vulnerabilities</a>	3	0	95
Score after Vulnerability Deductions:			95

FoundScore: Exposure - External	Your Results	Deductions	Running Score
<a href="#">Number of Non-Essential Services</a>	0	0	95
<a href="#">Number of Machines with No Essential Services</a>	0	0	95
<a href="#">UDP Permitted</a>	0	0	95

<b>ICMP Permitted</b>	<u>0</u>	0	95
		<b>Total Score</b>	95
			<b>Excellent</b>

To understand what systems and ports affected your FoundScore, click on the specific item of interest in the "Your Results" column in the above table.

#### FoundScore Details

Note: The Foundscore and Deductions shown above indicate the risk profile of your environment as last assessed by this scan on 2015-07-06 01:42:40. Updates to Vulnerability Risk rankings and Host Criticality impact the Foundscore calculation, hence it is possible that the details shown below have changed over time. Use Asset reporting to provide the most up-to-date assessment of your environment.

#### Non-Essential Services

Service Name	Protocol - Port	Affected System(s)
--------------	-----------------	--------------------

There is no data to display.

#### System(s) w/ No Essential Services

#### FoundScore Explained

FoundScore is a security ranking system that compares aspects of your environment against best practices in order to quantify your security risk. FoundScore is divided into 2 separate, yet related components:

<b>FoundScore: Vulnerabilities</b>	50 pts.	Based on the combination of high, medium and low risk vulnerabilities discovered within your environment, you are assessed a score between 0 and 50 points. Points are deducted for each vulnerability found based on its risk ranking (high, medium, low).
<b>FoundScore: Exposure</b>	50 pts.	A rating of how exposed your network is to Internet threats based on generally accepted security principles. A total of 50 points are possible. Points are deducted for each violation in 4 categories (described below).

Combined FoundScore 100 pts.

**Please note that if you are using only the Exposure level of service (no vulnerabilities checked), then the Exposure ranking is the only score available and the maximum score possible will be 50.**

The attributes of your environment that are assessed to determine your overall FoundScore rating (Vulnerabilities + Exposure) are as follows ([evaluation criteria is fully described below](#)):

- Does your environment possess vulnerabilities that can be exploited by attackers to harm your systems and/or potentially gain unauthorized access?
- Does your environment possess non-essential network services that increase the possibility of a security breach?
- Are there machines in your environment that do not perform a function considered inherent to normal Internet operations?
- Do you permit inbound UDP traffic to your network (other than DNS traffic on port 53)?
- Do you permit inbound ICMP to your network?

The comparison of your network against the five criteria listed above provides you a quantitative statement of your environment's security risk. Within the FoundScore system, a network starts with a full one-hundred (100) points. For each violation, a number of points are deducted from the original 100. Thus, a higher score reflects a more effective security posture (i.e. an environment with less risk). Conversely, a lower score indicates that your environment possesses more security weaknesses and consequently more risk. The highest score possible is 100, the lowest score is 0. The table below indicates the qualitative ratings assigned to the range of possible scores.

Score Range	Ranking
0 - 25	Poor
26 - 50	Below Average
51 - 70	Average
71 - 85	Above Average
86 - 100	Excellent

The points that are deducted from the starting score of 100 are based upon the criteria involved (i.e. How severe is the security weakness? How great is the risk?). When considering the number of vulnerabilities, non-essential services and machines without essential services discovered, the pervasiveness of the exposure is also considered (i.e. how many vulnerabilities, services, or machines were discovered). The points system is detailed in the table below.

The maximum deductions in each area (and the highest possible score) is 50; once 50 points have been deducted, no further deductions will take place for the Vulnerability or the Exposure rating (i.e. it is not possible to have a negative FoundScore, 0 is the lowest score).

#### FoundScore: Vulnerability

Criteria	Explanation
High Risk Vulnerability	For every high risk vulnerability discovered, 50 points are deducted from the FoundScore.
Medium Risk Vulnerability	For every medium risk vulnerability discovered, 10 points are deducted from the FoundScore.
Low Risk Vulnerability	For every low risk vulnerability discovered, 5 points are deducted from the FoundScore.
Informational Risk Vulnerability	For every informational vulnerability discovered, 0 points are deducted from the FoundScore.

## FoundScore: Exposure

Criteria	Explanation
Number of Non-Essential Services	For every non-essential service discovered, 1 point is deducted from the FoundScore.
Number of Machines without a Single Essential Service	For every machine discovered that is not hosting an essential service, 1 point is deducted from the FoundScore.
UDP Permitted	If UDP is permitted inbound to the network other than port 53 (DNS), 10 points are deducted from the FoundScore.
ICMP Permitted	If ICMP is permitted inbound to the network, 5 points are deducted from the FoundScore.

### External FoundScore does not indicate...

- *The effectiveness of your security policy*

To determine the effectiveness of any security policy, manual review of the policy itself is necessary, as well as in-depth knowledge of the network and its applications. Even if a policy is built around sound security principles, it may be poorly implemented. The FoundScore rating is based on generally accepted best practices for a typical environment. Your network may have unique needs so what is commonly considered an exposure could actually be an acceptable preference in your environment.

- *The likelihood of attack*

The attractiveness of an environment to potential attackers is somewhat intangible and impossible to quantify. Factors include a potential victim's reputation and prestige, an attacker's perception of monetary gain, the perceived value of vulnerable data and much more. Personal motives such as revenge (employee termination, for instance) must also be considered.

## Detailed Description of Evaluation Criteria

### FoundScore: Vulnerability

**High Risk** - Exploitation of the vulnerability discovered on the system can directly lead to an attacker gaining privileged access (e.g. administrator, root) to the machine over a remote connection. Examples: IIS Remote Data Services, RPC Automountd. A High score is quantified by falling within a 7-10 score overall. The overall score is calculated by averaging individual ratings including Simplicity, Popularity, and Impact.

**Medium Risk** - The vulnerability discovered on the system can directly lead to an attacker gaining non-privileged access (e.g. standard user) to the machine, or the vulnerability provides access that can be leveraged within one step to gain administrator level access. Examples: Microsoft IIS Translate f: Source Disclosure, Open and accessible NetBIOS ports. A Medium score is quantified by falling within a 4-6 score overall. The overall score is calculated by averaging individual ratings including Simplicity, Popularity, and Impact.

**Low Risk** - The vulnerability discovered on the system provides enticement data to the attacker that may be used to launch a more informed attack against the target environment. In addition, the vulnerability may indirectly lead to an attacker gaining some form of access to the machine over a remote connection. Examples: Anonymous FTP access, SNMP guessable community string. A Low score is quantified by falling within a 1-3 score overall. The overall score is calculated by averaging individual ratings including Simplicity, Popularity, and Impact.

**Informational Risk** - A finding on the system that provides data to an attacker that is of lesser value to an attacker than the enticement data provided by a low risk vulnerability. As a comparison, access to data using NetBIOS name table retrieval (NBTStat) is an informational vulnerability whereas the ability to enumerate Windows user accounts via a null session is a low vulnerability. Organizations may also not be able to address informational findings-- they may be inherent to the network services or architecture in use. For example, the SSH protocol requires a version number declaration, a support cipher and methods exchange to be included in the service banner. An informational score is quantified by a 0 score overall. The overall score is calculated by averaging individual ratings including Simplicity, Popularity, and Impact.

## FoundScore: Exposure

1. Number of Non-Essential Services

Services not critical to typical Internet-related business operations create significant security exposures. Common External security practices limit network services permitted and active within an environment to only those absolutely necessary. By reducing the number of active network services externally, you reduce the likelihood of security breaches. A network running 10 services, for example, is at greater risk than a network with five services because there are twice the number of services to configure, manage, update, and audit. And given the dynamic nature of security, even a small number of additional network services can create an exponential increase in exposure. New vulnerabilities are released on a frequent, often daily, basis. Nonetheless, the following services are essential to most networks externally:

Essential Services		
Service Name	Protocol	Ports
DNS	UDP	53
FTP	TCP	21
HTTP	TCP	80, 8080, 8000
HTTPS (SSL)	TCP	443
SMTP	TCP	25
SSH	TCP	22

For every non-essential network service (services not listed above) discovered to be accessible and active, one point is deducted from the overall FoundScore ranking, up to a maximum of 20 points.

2. Number of Machines without a Single Essential Service

Machines that do not perform a core business operation should be minimized and/or removed to reduce the risk of a security breach. Such machines increase system administration overhead and often host non-essential services ( see above) that pose additional security risks. In the FoundScore rating, a non-core machine is one that does not have an active, essential service. Any machine identified as alive (by responding to an ICMP request or one of a variety of TCP/UDP "pings"), but not running an essential service on a known port, is considered detrimental to the overall security posture.

For External scans, each machine discovered in this category, one point is deducted from the FoundScore ranking, up to a maximum of 15 points.

3. UDP Permitted Inbound to the Environment

For External scans, an Internet presence does not typically require UDP, with the exception of DNS handled on port 53. UDP is a security exposure because it is a common transport protocol for popular Denial of Service (DoS) attacks and backdoor programs such as trin00 and Back Orifice. In addition, the connection-less nature of UDP complicates monitoring and auditing UDP-based services.

If UDP is permitted in the environment other than on port 53, 10 points are deducted from the overall FoundScore.

4. ICMP Permitted Inbound to the Environment

Although useful for simple diagnostic testing, inbound ICMP creates significant exposure because it is the transport protocol of choice for popular DoS attacks such as mstream and Tribal Flood Network.

If ICMP is found permitted in an External scan, 5 points are deducted from the overall FoundScore.

## Services Description

### NETWORK SERVICE DESCRIPTIONS

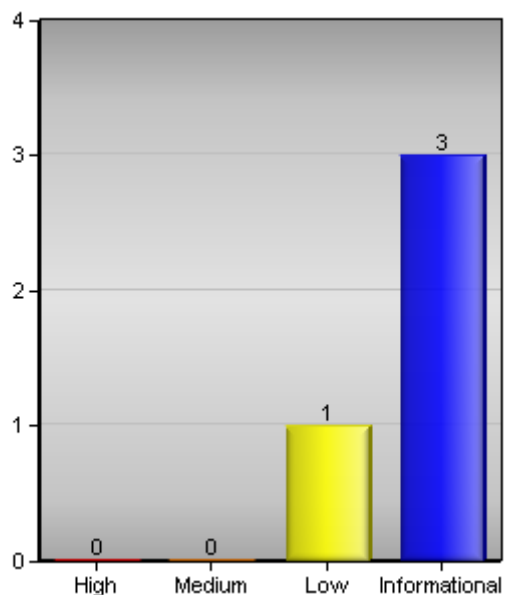

#### Network Service Descriptions

Service Name	Standard Port	Description
Secure Shell	22 - tcp	The secure shell (SSH) service is used as a secure replacement for cleartext, interactive logon services such as rlogin, rsh and telnet. SSH was written by Tatu Ylonen and SSH Communications Security in Finland. SSH uses multiple cryptographic algorithms to ensure data integrity and security. We highly recommend that ssh be used as a replacement for any cleartext login services. We also recommend that you use TCP wrappers to restrict who can connect to your SSH daemon. TCP wrappers are typically a standard package on most Unix flavors.
Hyper Text Transfer Protocol	80 - tcp	The WWW (World Wide Web) service allows transfer of webpages in hypertext markup language (HTML) format to be interpreted by a web browser. There are many security vulnerabilities in web applications and servers that may allow a remote user access to the system in some manner. The best recommendation is to audit your web application's code, searching for weaknesses in security design. In addition, you should remove any unnecessary programs and files from the server to reduce your vulnerability to known security holes.
HTTP over SSL	443 - tcp	Secure Sockets Layer (SSL) is a security protocol that provides communications privacy over the Internet. The protocol allows client/server applications to communicate in a way that is designed to prevent eavesdropping, tampering, or message forgery. It is highly recommended that this protocol be used during web commerce transactions.

# Vulnerability Details Report

## VULNERABILITY DETAILS

### Vulnerability Details

#### Common Directory Name(s) Detected

##### Description:

The script that reported this vulnerability enumerates commonly named directories on the remote web server. Common directory names may reveal information to a potential attacker, thereby representing an information disclosure issue. Specifically, this script attempts to access directories that are commonly associated with source control, backup, logging and other administrative functions. Some examples of directories looked for:

AdminWeb

CVS

bugzilla

devel

log

The list of directories checked is extensive, but all directory names are chosen so that they have a logical connection to administrative functionality (see example directories above).

##### Recommendation:

Make sure that the directory names found should be accessible to the public. If they should not be publicly accessible, verify that appropriate controls have been placed on them (perhaps by requiring authentication, requiring a certain IP address, etc).

By enumerating popular names for directories on your webserver, an attacker may be able to gain a great deal of information about your web application's administrative functionalities.

This report may serve simply as a notification that directories that may not be intended for public use are nevertheless publicly accessible.

##### Observation:

None

##### Affected System(s)

System	Criticality	Operating System
ec2-54-174-156-235.compute-1.amazonaws.com	None	Linux 2.4.x

54.174.156.235

#### SSL Web Server Version Detected

##### Description:

Version information was obtained from the SSL web server.

##### Recommendation:

Ensure that SSL web server complies with the corporate policy.

##### Observation:

SSL is a network communication protocol that allows a secure communication between a client and a server. Version information was obtained from the SSL web server.

##### Affected System(s)

System	Criticality	Operating System
ec2-54-174-156-235.compute-1.amazonaws.com	None	Linux 2.4.x

54.174.156.235

#### Web Server HTTP Protocol Version Detected

##### Description:

HTTP protocol version was obtained from the host through web server.

##### Recommendation:

Ensure that web server complies with organizational policy.

##### Observation:

Web servers are widely used to serve static and dynamic content and render it in the client's browser. HTTP protocol version was obtained from the host through web server.

##### Affected System(s)

System	Criticality	Operating System
--------	-------------	------------------

HTTP Server Prone To Slow Denial Of Service Attack

5.0Informational

Description:

A denial of service vulnerability is present in some HTTP servers.

Recommendation:

There are no patches available from the vendor at the moment of writing this document (10/16/11).  
A workaround to this, although not a final solution, is to decrease the Timeout setting for Apache to 10 seconds or less, instead of the default 5 minutes. Particular considerations have to be considered depending on each organization and the type of clients expected to connect to their web servers.  
For example, the timeout and minimum data rate for receiving requests can be set by enabling the apache module "mod\_reqtimeout",  
[http://httpd.apache.org/docs/2.3/mod/mod\\_reqtimeout.html](http://httpd.apache.org/docs/2.3/mod/mod_reqtimeout.html)  
HTTP servers that use the asynchronous I/O technique are not vulnerable to this attack. Some of those servers are: lighttpd, nginx, Apache's experimental event MPM, IIS 6, IIS7, Cherokee, etc.

Observation:

Apache HTTP Server is a widely used Web server. Apache -and other Web servers- bound each connection to a different process or thread.  
A denial of service vulnerability is present in some HTTP servers. The DoS occurs because the server allows incomplete connections to stay open for an unnecessary period of time. Processes are a limited resource, and thus the server cannot have infinite connections but instead a limited number of clients connected at the same time. The attacker will create multiple slow incomplete connection requests to the server causing it to reach the connections limit and make the server to stop responding to other legit requests.

## Web Vulnerabilities By Application

Common Directory Name(s) Detected

 Low

### Description:

The script that reported this vulnerability enumerates commonly named directories on the remote web server. Common directory names may reveal information to a potential attacker, thereby representing an information disclosure issue. Specifically, this script attempts to access directories that are commonly associated with source control, backup, logging and other administrative functions. Some examples of directories looked for:

- AdminWeb
- CVS
- bugzilla
- devel
- log

The list of directories checked is extensive, but all directory names are chosen so that they have a logical connection to administrative functionality (see example directories above).

### Recommendation:

Make sure that the directory names found should be accessible to the public. If they should not be publicly accessible, verify that appropriate controls have been placed on them (perhaps by requiring authentication, requiring a certain IP address, etc).

By enumerating popular names for directories on your webserver, an attacker may be able to gain a great deal of information about your web application's administrative functionalities.

This report may serve simply as a notification that directories that may not be intended for public use are nevertheless publicly accessible.

# Vulnerability Check Configuration Report

## Vulnerability Check Report

This report shows which vulnerability checks the last scan used. It compares this scan with the previous scan and shows which checks were added or removed. ☒ represents vulnerability checks in this scan that were not in the previous scan. ☐ represents those checks that were in the previous scan, but not this one.

Microsoft IIS WebDAV PROPFIND/SEARCH Request Denial Of Service Vulnerability	<a href="#">CVE-2001-0151</a>	2010-08-31 15:08:10 UTC	8319
Microsoft IIS NTLM Authentication Disabled	-	2010-03-30 13:07:42 UTC	8323
Microsoft IIS FrontPage Extensions Enabled	-	2010-03-31 10:45:40 UTC	8340
Microsoft IIS Anonymous Access Enabled	-	2010-03-31 11:56:38 UTC	8342
Microsoft IIS Basic Authentication Scheme Disabled	-	2010-03-31 12:49:01 UTC	8344
Oracle BEA WebLogic Server Console WLST Privilege Escalation Vulnerability	<a href="#">CVE-2008-2577</a>	2010-06-30 14:06:21 UTC	8356
Microsoft IIS HTR Scripting Support Detected	-	2010-09-30 17:09:51 UTC	8357
Oracle BEA WebLogic Server Console Log Privilege Escalation Vulnerability	<a href="#">CVE-2008-2578</a>	2010-06-30 14:06:20 UTC	8360
Microsoft IIS IISADMPWD Virtual Directory Detected	-	2010-04-01 08:47:37 UTC	8367
Microsoft IIS Index Server Web Interface Accessible	-	2010-09-30 17:09:53 UTC	8374
Oracle Application Server Forms Component Multiple Unspecified Vulnerabilities	<a href="#">CVE-2006-0284</a>	2010-08-31 15:08:17 UTC	8375
Microsoft IIS Sample Application Cross Site Scripting Vulnerability	-	2010-04-02 07:25:26 UTC	8380
Microsoft IIS Internet Database Connector Mapping Detected	-	2010-04-02 08:14:10 UTC	8383
Microsoft IIS Internet Printing Detected	-	2010-04-02 08:14:39 UTC	8384
Microsoft IIS Host Name Setting Enumerated	-	2010-04-02 09:32:56 UTC	8385
Microsoft IIS MSADC Virtual Directory Detected	-	2010-09-30 17:09:55 UTC	8388
Microsoft IIS Printers Virtual Directory Detected	-	2010-04-05 09:31:07 UTC	8425
Microsoft IIS Scripts Virtual Directory Detected	-	2010-04-05 09:58:24 UTC	8426
IBM WebSphere Application Server wsadmin Vulnerability	<a href="#">CVE-2010-0769</a> <a href="#">CVE-2010-0770</a>	2010-04-13 21:04:02 UTC	8427
Microsoft IIS Server Side Include Scripting Interfaces Detected	-	2010-04-05 10:38:39 UTC	8428
Microsoft IIS Sample Application Web Root Absolute Path Disclosure Detected	-	2010-09-30 17:09:58 UTC	8432
Microsoft IIS Script Source Access Not Disabled	-	2010-04-06 11:43:51 UTC	8437
Microsoft IIS Cross Site Scripting Vulnerability	<a href="#">CVE-2000-1104</a>	2010-08-31 15:08:06 UTC	8438
Microsoft IIS Server Extensions Enumerated	-	2010-04-07 07:37:58 UTC	8445
IBM WebSphere Application Server Administrative Console Login Accessible	-	2010-04-07 07:51:59 UTC	8447
Microsoft IIS Server Script Mapping Configuration Presence Detected	-	2010-04-07 11:34:49 UTC	8448
Microsoft IIS Printers Directory Authentication Interface Brute Force	-	2010-04-07 11:55:08 UTC	8449
Microsoft IIS Localstart Page Authentication Interface Brute Force	-	2010-04-07 12:03:14 UTC	8450
Oracle Application Server Portal Component Unauthorized Modification Vulnerability	<a href="#">CVE-2008-5438</a>	2010-06-30 14:06:13 UTC	8451
Oracle Application Server WWW_RENDER_REPORT SQL Injection Vulnerability	<a href="#">CVE-2008-2589</a>	2008-07-16 18:51:10 UTC	8455
Oracle BEA WebLogic Server Unspecified Vulnerability (CVE-2008-5461)	<a href="#">CVE-2008-5461</a>	2010-06-30 14:06:20 UTC	8457
Oracle Application Server Portal Component Unspecified Vulnerability (CVE-2008-2593)	<a href="#">CVE-2008-2593</a>	2010-06-30 14:06:12 UTC	8465

Check Name		CVE Number	Date	ID
